The Perception of the Environment: Essays on Livelihood ...

Perception describes the multiple ways in which people receive information from their surroundings, allowing them to know their environment. Cognition, or the way people understand the environment, occurs through immediate sensory experience coupled with memories and experiences from the past. While psychologists often treat these as different phenomena or faculties, the papers in this section challenge that bifurcation.

Section 2: Human Perception and Environmental Experience ...

Public perceptions towards the UK marine environment As well as understanding and recognising the value the marine environment brings to individuals and society, we also need to understand individual/societal perceptions towards the marine environment, particularly around specific marine policy issues such as marine spatial planning (McKinley and others, 2019).

Evaluating public perceptions - Centre for Environment ...

'The Perception of the Environment is a formidable work in terms of its intellectual breadth ... its sheer volume ... and methodical consistency and clarity.' - 'The Journal of the Royal Anthropological Institute ' ... this is an extremely significant book and quite possibly lives up to its promise "to revolutionize the way we think".

An integrated approach to understanding how people live, learn, work in and perceive their environments.

In this work Tim Ingold offers a persuasive new approach to understanding how human beings perceive their surroundings. This book is essential reading not only for anthropologists but also for biologists, psychologists, archaeologists, geographers and philosophers.

In this work Tim Ingold offers a persuasive new approach to understanding how human beings perceive their surroundings. He argues that what we are used to calling cultural variation consists, in the first place, of variations in skill. Neither innate nor acquired, skills are grown, incorporated into the human organism through practice and training in an environment. They are thus as much biological as cultural. To account for the generation of skills we have therefore to understand the dynamics of development. And this in turn calls for an ecological approach that situates practitioners in the context of an active engagement with the constituents of their surroundings. The twenty-three essays comprising this book focus in turn on the procurement of livelihood, on what it means to 'dwell', and on the nature of skill, weaving together approaches from social anthropology, ecological psychology, developmental biology and phenomenology in a way that has never been attempted before. The book is set to revolutionise the way we think about what is 'biological' and 'cultural' in humans, about evolution and history, and indeed about what it means for human beings – at once organisms and persons – to inhabit an environment. The Perception of the Environment will be essential reading not only for anthropologists but also for biologists, psychologists, archaeologists, geographers and philosophers. This edition includes a new Preface by the author.

An integrated approach to understanding how people live, learn, work in and perceive their environments.

Aimed at students taking a course on visual perception, this textbook considers what it means for a man, a monkey and a computer to perceive the world. After an introduction and a discussion of methods, the book deals with how the environment produces a physical effect, how the resulting "image" is processed by the brain or by computer algorithms in order to produce a perception of "something out there". It also discusses color, form, motion, distance, and also the sensing of three dimensionality, before dealing with visual perception and its role in awareness and consciousness. The book concludes with discussions of perceptual development, blindness, and visual disorders. Visual perception is by its very nature an interdisciplinary subject that requires a basic understanding of a range of topics from diverse fields, and this is a very readable guide to all students whether they come from a neuroscience, psychology, cognitive science, robotics, or philosophy background.

By describing the fabric of relationships indigenous peoples weave with their environment, The Land Within attempts to define a more precise notion of indigenous territoriality. A large part of the work of titling the South American indigenous territories may now be completed but this book aims to demonstrate that, in addition to management, these territories involve many other complex aspects that must not be overlooked if the risk of losing these areas to settlers or extraction companies is to be avoided. Alexandre Surralls holds a doctorate in anthropology from the School for Higher Studies in Social Sciences and is a researcher on the staff of the National Centre for Scientific Research. Pedro Garcia Hierro is a lawyer from Madrid Complutense University and the Pontifical Catholic University of Peru. He has worked with various indigenous organizations, on issues related to the identification and development of collective rights and the promotion of intercultural democratic reforms.

Taking a unique anthropological approach, Bush Base: Forest Farm explores the management of resources in third world development programmes. The contributors, all distinguished anthropologists with practical experience of development projects, focus on the role of human cultural imagination in the use of environmental resources. They challenge the traditional sharp distinction between human settlement and natual environment (farm or camp, forest or bush), and argue that development programmes should place at their centre an appreciation of people's cosmologies and cultural understandings.

This edited volume is a compilation of the 'built environment' in response to many investigations, analyses and sometimes mere observations of the various dialogues and interactions of the built, in context to its ecology, perception and design. The chapters concentrate on various independent issues, integrated as a holistic approach, both in terms of theoretical perspectives and practical approaches, predominantly focusing on the Global South. The book builds fabric knitting into the generic understanding of environment, perception and design encompassing 'different' attitudes and inspirations. This book is an important reference to topics concerning urbanism, urban developments and physical growth, and highlights new methodologies and practices. The book presumes an understanding unearthed from various dimensions and again woven back to a common theme, which emerges as the reader reads through. Various international experts of the respective fields working on the Global South contributed their latest research and insights to the different parts of the book. This trans-disciplinary volume appeals to scientists, students and professionals in the fields of architecture, geography, planning, environmental sciences and many more.

What are the links between environment and world view? Topophilia, the affective bond between people and place, is the primary theme of this book that examines environmental perceptions and values at different levels: the species, the group, and the individual. Yi-Fu Tuan holds culture and environment and topophilia and environment as distinct in order to show how they mutually contribute to the formation of values. Topophilia examines the search for environment in the city, suburb, countryside, and wilderness from a dialectical perspective, distinguishes different types of environmental experience, and describes their character.
